About the Exhibition

This exhibition is a visual experience demonstrating what inspires Roger to do astrophotography. From the wide horizons of the Wheatbelt to the similarly expansive West Australian night sky vistas, and to the extremely faint, yet so fascinating and thought provoking objects of deep space.

The distant galaxies and nebulas, the "faint and fuzzy" objects, are what pushes Roger's equipment and skills to the limits, whilst the wide field and landscape photographs capture the impressive skies and wide flat horizons of Western Australia that leaves visitors in awe.

This exhibition features a selection of Roger's wide field astrophotography as high quality prints, as well as a collection of his photographs of deep space objects including galaxies and galaxy clusters, globular clusters, open clusters and nebulas. See just how diverse and interesting the night sky is with hundreds of objects shown and wonder what else might be out there to be photographed.
